

#### **N84. Crawling Around Byron**

ROV Technologies has been awarded a contract by Commonwealth Edison for the Byron plant to supply a miniature, remotely operated, electric crawler.

The first planned use for the crawler will be for the internal visual inspection of the reactor vessel head after removal from the reactor vessel. Components of the crawler include lights, radiation-tolerant, high-resolution cameras, and a modular electric manipulator which is interchangeable with ROV Technology's underwater inspection/retrieval system.
