

N149. Bar Code System

The Sorrento Electronics' bar code system generates precise management reports, eliminates handwritten and keyboard data entry errors, decreases paperwork, reduces unaccountable parts and equipment, and improves inventory control. Its applications include valve line-up verification for the operations department, measuring and test equipment inventory control for the I&C department, tool inventory control for the maintenance department, hanger and snubber visual inspection for the in-service inspection department, parts inventory control for the warehouse department, personnel accountability for the emergency planning department, and portable survey instrument inventory control for the health physics department. The system will use SE's customized software, computer hardware, bar code printer, portable data collectors, and laser scanners. SE will deliver, test, and install the hardware and provide on-site training.
