

N154. Fluorescent Lamps

Shat-R-Shield (reg. TM) has developed a safety-coated fluorescent lamp that does not shatter. If a Shat-R-Shield fluorescent lamp breaks, the lamp's safety coating forms a protective envelope around the lamp so that glass shards, phosphors, and mercury are contained within the coating. As a result, employees and the worksite are protected from contamination and exposed glass. Shat-R-Shield lamps are used in a variety of safety-conscious industries including nuclear facilities.
