

N373. Full-System Decontamination Of Indian Point 2

Consolidated Edison and VECTRA Technologies announced the successful completion of the first full-system chemical decontamination of an operating U.S. commercial power reactor using Atomic Energy of Canada Limited's CAN-DEREM Service solvent. The decontamination of Con Edison's Indian Point 2 power plant included the entire reactor coolant system, except the fuel. This procedure was accomplished during Indian Point's 1995 refueling and maintenance outage.
