

**N3429. USERS MANUAL, WASTECOST: WET MODULE, VERSION 1.0**

As utilities continually strive to improve their position in a competitive environment, process enhancements that result in reduced operating expenditures become more critical. The costs associated with liquid waste processing and its resultant solid radioactive waste can be successfully reduced. In many instances this can be accomplished through liquid processing improvements, improved program management, and waste packaging and disposition alternatives. This program is intended to provide a tool for identifying and analyzing changes that can potentially result in the most significant program cost reductions and process improvements.
