FUEL SIPPING

Keywords: FUEL SIPPING; CONTAMINATION PREVENTION; OPERATIONAL AND CHEMISTRY CONTROL; FUEL; DEFECTS; FUEL; INSPECTION; LEAK DETECTION

Description:

Fuel failures over extended operating cycles has resulted in increased out of core radiation levels not to mention increased dose resulting from increased measures to reduce fission product contamination. Early detection and removal of defective fuel will reduce the dose to workers associated with fission products. Fuel sipping programs conducted at BWR during outages and forced outages have been effective in identifying defective fuel, and reducing the additional dose resulting from failed fuel.
