

ABSTRACT

Target: One ODCM

Steve Sandike
IPEC

This paper covers the key challenges of “combining” effluent programs that had diverged significantly over the years as a result of being two different utilities, not just two units. In the process of merging, each unit’s methods (sampling, quantifying, reporting, etc) fell under equal scrutiny and often, entirely new methods were determined to be needed. Key elements such as compliance with 10CFR20 and ALARA (part50 App I) received top priority, but the majority of changes occurred in sampling methods and administrative controls. While milestones are identified, the end result will be one station ODCM.
